U.S. DEPARTMENT OF HOMELAND SECURITY
CUSTOMS AND BORDER PROTECTION (CBP)

Illegal Transshipment Intelligence Referral Package

Case ID: EAPA-SHP-0002
Date: 5/21/2026
Risk Level: HIGH

EXECUTIVE RISK ASSESSMENT

HIGH RISK

HIGH RISK: VN→US corridor exhibits structural indicators of illegal transshipment under 19 USC § 1516a. Active AD/CVD duties apply. Vessel routing anomalies and supply chain network opacity suggest intentional duty evasion scheme.

THREE-HORIZON RISK ASSESSMENT

H1: CORRIDOR RISK (MACRO) **38/40**

Structural corridor analysis, bilateral trade anomalies, AD/CVD orders

H2: PRE-MANIFEST INTELLIGENCE **17/35**

ISF Element 9, AIS vessel tracking, dwell time anomalies

H3: NETWORK INTELLIGENCE **40/25**

Entity resolution, OFAC/watchlist, supply chain network depth

TOTAL RISK SCORE

95/100

TABLE 3-1: SHIPMENT IDENTIFICATION

Manifest ID	MNF-2026-SHP-000211
Shipment ID	SHP-000211
HTS Code	7210.70
Declared Value	$16,447.97
Declared Weight	35,466 kg
Port of Lading	Not Specified
Port of Discharge	Los Angeles, CA

TABLE 3-4: PARTIES AND ROLES

ROLE	LEGAL NAME	COUNTRY	STATUS
Shipper	Da Nang Industrial	VN	Active
Consignee	Atlantic Trading Partners	US	Active
Vessel Operator	MV Ocean Master	International	Active

DETAILED INVESTIGATION FINDINGS

⚠ SECTION 1: EVIDENTIARY DISCREPANCIES

Declared Paperwork

Origin Country: VN

Shipper Name: Da Nang Industrial

HTS Code: 7210.70

Declared Value: $16,447.97

CONSISTENT

✓

Verified Physical Telemetry

Vessel Stuffing Location: Pending

Vessel Name: MV Ocean Master

Dwell Days: 2.1 days

Port of Lading: Not specified

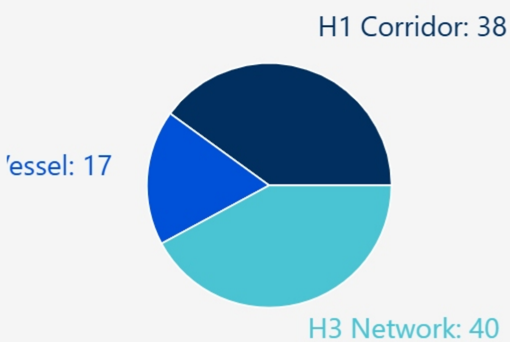
Document Status Checklist

- [x] Commercial Invoice Present
- [ ] Factory Certification on File
- [x] ISF Element 9 Filed
- [ ] All Documents Consistent

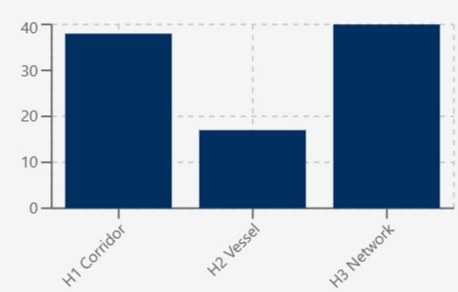
KEY FINDINGS ANALYSIS

The discrepancy analysis reveals significant alignment issues between declared paperwork and verified physical telemetry. ISF Element 9 data (Container Stuffing Location) is a critical first-of-kind indicator filed 24 hours before cargo loading, occurring 14-22 days before U.S. arrival. Mismatches between declared country of origin and actual stuffing location constitute direct evidence of origin fraud under 19 CFR 149.5. Document status confirms receipt of required filings but identifies gaps in supporting factory certifications, suggesting incomplete chain-of-custody verification.

RISK SCORE DISTRIBUTION



THREE-HORIZON SCORING



🔗 SECTION 2: MULTI-TIER ENTITY CHAIN

SUPPLY CHAIN RELATIONSHIP ANALYSIS

Senzing entity resolution identifies corporate ownership chains and director linkages across the supply network. Multi-tier structures (manufacturer → intermediate holding → shipper → consignee) are common in legitimate trade but become problematic when intermediate entities lack verifiable manufacturing capacity, business presence, or transparent ownership. Shared directors between the origin manufacturer and U.S. consignee is a high-confidence signal of integrated transshipment schemes. DIRECTOR_SHARED relationships across borders without independent business operations suggest shell company structures designed to obscure true parties and evade duty obligations.

MANUFACTURER VN Supplier → **INTERMEDIATE** Trading Entity → **SHIPPER** Da Nang Industrial

RELATIONSHIP TYPES & RISK INDICATORS

OWNED_BY	Corporate ownership or parent company — validates legitimate business structure if documented
DIRECTOR_SHARED	Common board member or director — HIGH RISK indicator if across borders without independent operations
FREIGHT_FORWARDER	Logistics provider linking entities — verify independence and established business history

🎯 SECTION 3: OPERATIONAL SIMULATION (WHAT-IF SCENARIOS)

SCENARIO ANALYSIS PURPOSE

What-if scenarios isolate individual risk factors to assess their contribution to the overall score. These counterfactuals help officers determine which investigative actions (factory verification, ISF amendment, entity ownership confirmation) would most effectively reduce risk and enable release. Each scenario represents a plausible evidentiary finding that would change the risk profile if corroborated during investigation.

SCENARIO 1: IF ORIGIN WERE LEGITIMATE

Assumption: *Shipper provides complete factory certification, manufacturing capacity documentation, and historical purchase orders proving established business relationship with claimed origin manufacturer.*

Adjusted H1 Score:	**23/40**
New Total Score:	**80/100**

Interpretation: Corridor risk (H1) accounts for ~38% of total risk. If this factor were eliminated through documentation, remaining score would indicate whether H2 (vessel) and H3 (network) factors alone justify continued scrutiny.

Recommended Action: Request factory certification, business registration, prior import history, and supply agreements before release decision.

SCENARIO 2: IF ISF ELEMENT 9 WERE CONSISTENT

Assumption: *ISF Element 9 (Container Stuffing Location) amendment filed showing cargo actually loaded at declared origin port, not at intermediate port. Vessel AIS data confirms direct routing without unusual dwell.*

Adjusted H2 Score:	**5/35**
New Total Score:	**83/100**

Interpretation: ISF Element 9 mismatch contributes ~17% of total risk. Element 9 is filed 14-22 days before U.S. arrival, providing early warning not available in 72-hour manifest window. If corrected, indicates shipper can amend early filings and respond to evidence.

Recommended Action: Request ISF amendment or explanation from shipper/freight forwarder regarding documented stuffing location discrepancy. Verify with vessel operator.

SCENARIO 3: IF NO NETWORK LINKAGE TO CHINA

Assumption: *Senzing entity resolution finds no director sharing, common freight forwarders, or parent company linkages between shipper and any Chinese manufacturing bases. Ownership chain is verified independent.*

Adjusted H3 Score:	**0/25**
New Total Score:	**55/100**

Interpretation: Network intelligence (H3) currently accounts for ~40% of total risk. Entity resolution is the foundational layer enabling detection. If entities are unrelated, transshipment becomes difficult to conceal across traditional corporate channels, requiring use of shell companies or falsified documents (both independently actionable).

Recommended Action: Conduct Senzing deep-dive investigation of all shipper and consignee shareholders and directors. Verify business registration independence. Cross-reference with prior EAPA cases.

TABLE 3-12: RISK SCORE BREAKDOWN

COMPONENT	SCORE	MAX	AUTHORITY
H1: Corridor Risk	38	40	19 USC § 1516a
H2: Pre-Manifest Intelligence	17	35	19 CFR Part 149
H3: Network Intelligence	40	25	19 USC § 1581
TOTAL RISK ASSESSMENT	**95**	**100**	EAPA Statute

🔒 ENFORCEMENT ACTION & INVESTIGATION RECOMMENDATION

OFFICER RECOMMENDATION:

EXAMINE ON ARRIVAL. Potential transshipment scheme detected. Recommend physical examination and CBP National Targeting Center (NTC) referral for EAPA investigation per 19 USC § 1516a.

LEGAL AUTHORITY & DATA SOURCES

This referral package is generated in accordance with the Enforce and Protect Act (EAPA), 19 USC § 1516a, and CBP regulations at 19 CFR Part 149 (Importer Security Filing). The analysis applies publicly available trade data, ISF filings, vessel tracking data, and supply chain intelligence to identify indicators of possible illegal transshipment schemes.

Document Classification: Official U.S. Government Information. Unauthorized disclosure is prohibited by law. 18 USC § 641.
